

Plan to Harness the Colorado

These illustrations show the proposed plan to harness the Colorado River for both power and irrigation purposes, the want of which is retarding the development of the great Southwest. The map shows the course of the river, the inset depicting Boulder Canyon as it would appear with a dam. The canyon, as it is today, with the height of the proposed dam indicated also is shown. The diagram indicates the drop of the river from above Glen Canyon. The man at the top is W. A. Brackenridge, senior vice-president of the Southern California Edison Company, which is behind this initial project. He is regarded as a national authority on hydro-electric development. The other man is E. F. Scattergood, chief electrical engineer for the bureau of power and light of the city of Los Angeles, who is much interested in the proposed development.
